

1. 10 Data types in Mysql.

- A. Char.
- B. VARCHAR
- C. INT
- D. STRING
- E. DATE AND TIME
- F. TEXT
- G. BOOLEAN
- H. BIGDECIMAL
- J.MONEY
- K.FLOAT

2. I would use CHAR most likely when I just want a numbers and letters together.

Varchar I would use when I need to have the size greater than just Char.

I would use int when I need a whole number less than 2,147,483,647

I would use string when I want names of items or works saved

Date and time I would use when we are storing well days and times hehe

Text I would use when we are storing instructions pages in a book and things like that.

Booleans are used for true and false

I would use BIGDECIMAL when I need to store a large decimal

I would use money when dealing with prices and balances

floats I would use for something like a temperature.

3. I really enjoyed learning about joining tables and how to get data out of multiple tables at once.
